Gypsum**

L-CBF **BOOST**

## Feed your soil microbes

A food source for soil microbes and fungi following a prolonged wet autumn and winter, which improves nutrient availability and cycling by feeding the soil biology. L-CBF Boost supports the long-term building of soil organic matter, which is important for soil resilience and water management.

Phosphorus  
**Liberator**

## The key to accessing soil nutrition

Phosphorous is an important element for tree growth and development, some soils have adequate reserves of phosphorous but is often unavailable for uptake. Phosphorous Liberator displaces locked up phosphate and makes it available for plant uptake whilst improving soil health.

**Liquid**  
Gypsum

## Building your soil structure

Gypsum aids flocculation, which bonds soil particles together to form aggregates, improving soil porosity, workability, and drainage. Important when rebalancing high Ca:Mg soils, especially those which are high in Mg. Applications of Liquid Gypsum improve both soil structure and soil health.
